# 1. Introduction:

## 1.1 Project Overview

An ATS (Applicant Tracking System) optimized resume analyser using the Gemini API model is designed to improve the likelihood of a resume passing through an ATS and reaching a human recruiter. Many companies use ATS to filter resumes before they reach hiring managers. An ATS-optimized resume analyser ensures that resumes are formatted and contain keywords that make them ATS-friendly. By using an AI model like Gemini, the process of optimizing and analysing resumes becomes faster and more accurate.

### Key Features:

The Gemini API can identify and suggest relevant keywords based on the job description and industry standards. It can provide guidance on how to format resumes to ensure they are ATS-compliant (e.g., using standard fonts, avoiding images, etc.). Resumes are scored based on their alignment with job descriptions, and specific feedback is provided to improve the score. Additionally, the analyser checks the resume's compatibility with various ATS software systems, ensuring a higher chance of passing the initial filter.

### How It Works:

The user uploads their resume and inputs the job description. The Gemini API analyses the resume, comparing it against the job description and ATS requirements. The tool then provides a score, feedback, and suggestions for improvement.

### Benefits:

This tool increases the chances of the resume reaching a recruiter by ensuring it passes through ATS filters. It automates the optimization process, saving time for job seekers. Moreover, it tailors the resume to specific job descriptions, enhancing its relevance.

### Use Cases:

Job seekers looking to improve their resume's chances of passing ATS filters can benefit from this tool. Career coaches can assist clients in optimizing their resumes, and recruitment agencies can ensure their candidates' resumes are ATS-compatible.

## **1.2. Objectives**

The objective of this project is to create a functional model of an ATS-optimized resume analyzer that takes advantage of Gemini. This prototype will allow users to upload resumes and receive analysis reports tailored to Applicant Tracking Systems, thereby increasing the efficiency and effectiveness of the recruitment process.

## **2. Project Initialization and Planning Phase**

### **2.1 Problem Statement**

In today's job market, a big issue for job seekers is developing resumes that not only highlight their qualifications but also pass through Applicant Tracking Systems. Employers utilise ATS software to speed up the recruiting process by sorting and rating resumes based on keywords, formatting, and other algorithmic factors. However, due to poorly optimised resumes, these methods frequently result in the rejection of many eligible individuals.

Job seekers, particularly those inexperienced with the specifics of ATS, struggle to ensure that their resumes are compatible with these systems. Common problems include incorrect formatting, a lack of relevant keywords, and structural errors, which can lead to their applications being screened out before they reach a person. This is a considerable barrier to employment, since even highly skilled people may not be considered for positions owing to technical errors in their resumes.

### **2.2 Proposed Solution**

A tool that can assist job seekers in optimizing their resumes, specifically for ATS compatibility, is vitally required. This solution need to provide a thorough analysis as well as useful suggestions for enhancing resumes and making sure they meet the various requirements used by ATS. The improved capabilities of the Gemini AI Model may be used to create an ATS-Optimized Resume Analyzer in order to get around this problem. The application would assess resumes, point out areas that needed work in terms of formatting, keyword usage, and content organization, and offer detailed suggestions to help users increase the likelihood that their resumes would get past ATS filters. Job seekers would be able to more effectively showcase their qualifications in this way, improving their chances of being permitted for interviews.

## **2.3 Initial Project Planning**

- Gathering the necessary requirements that are needed for developing the project.
- Researching and experimenting with the current solutions available for developing the project.
- Evaluating the feasibility of integrating the modules that are required for the project.
- Exploring different resume documents in order to understand the standard format that is optimized for ATS resume analyzer.

### **3. Model Development Phase**

#### **3.1 Requirements Specification**

A requirements text file is need to be created in order to install Python modules that are required to develop a functional code for this project.

i) Creation of requirements.txt file

The text file contains these following modules:

```
streamlit  
streamlit_extras  
google-generativeai  
python-dotenv  
PyPDF2  
Pillow
```

ii) Installation of the modules

The modules that will be used in this project are installed by performing this command in the Python terminal.

```
pip install -r requirements.txt
```

This process takes few minutes to be installed in an IDE.

#### **3.2 Initialization of Google API Key**

The Gemini API key allows developers to safely access and incorporate Google's advanced AI models into their apps. Developers may authenticate and authorize their apps to utilize Gemini AI models by creating an API key in Google AI Studio and include it in API calls, resulting in improved security and scalable AI solutions.

The API key is generated by accessing the Google AI Studio. The key is generated by the user who is signed in with a personal account.

After API key is generated, the key is used for the initialization of the API by creating an '.env' file, where the API key is inserted into this file.

### 3.3 Interfacing with Pre-trained Model

To interface with the pre-trained model, an .py file is created named app, which will contain both the Gemini AI model and StreamLit UI code.

i) Load the Gemini Pro pre-trained model:

Importing required libraries and modules, such as dotenv, Streamlit, os, PyPDF2, GenerativeAI from Google, PIL (Python Imaging Library), and a custom module for providing vertical space to Streamlit.

The load\_dotenv() method is used to load environment variables from the .env file.

The Google API key is set up in the Generative AI module and is kept in the environment variable GOOGLE\_API\_KEY.

A Generative AI model object named "model" is built by using Google Gemini AI's Gemini Pro pre-trained model.

ii) Implement a function to get Gemini model's response and to read the contents of the PDF:

The function get\_gemini\_response takes an input as a text.

The model then generates a response using the input provided in a text format.

The response that is generated by the model, is then returned as a text.

The function input\_pdf\_text takes an input as the file uploaded by the user.

A PDF reader object is created using PyPDF2 module to convert the uploaded PDF file into a readable format. A 'text' variable is initialized as an empty string.

Using for loop, it reads every content from each page of the PDF file through each iterations and extracts the text from the file and stores it in the 'text'.

The stored content in 'text' is returned.

iii) Writing a prompt for Gemini model:

An ATS (Applicant Tracking System) is instructed in a multiline text called `input_prompt`. It defines the level of expertise needed to pass the ATS, including proficiency in a range of technical fields including data science and software engineering.

In a competitive job market, the applicant tracking system's (ATS) goal is to evaluate applicants based on job descriptions offered.

Three components are requested in the response: a summary of the profile, a list of keywords that are missing, and the percentage of the response that matches the job description.

### **3.4 Model Deployment using StreamLit:**

i) Integrate with Web Framework:

The web framework is designed using StreamLit and for this project, it is designed into four sections of the application.

a) Introduction:

The given code configures the page layout for a Streamlit application titled "Resume ATS Tracker".

It then generates a layout with two columns, with the first three times wider than the second.

The first column has the term "CareerCraft" as well as a header and markdown text presenting CareerCraft as an ATS-Optimized Resume Analyzer.

In the second column, a picture from a URL is shown, with the width adjusted to match the column.

Overall, the code generates a visually appealing interface for the CareerCraft programme, using text and graphics to explain its capabilities and benefits to users.

#### b) Offerings:

The given code uses Streamlit to generate a two-column layout, with the first column having an image and the second column containing a header followed by a list of offerings.

The title "Wide Range of Offerings" presents the list, which includes services such as ATS-Optimized Resume Analysis, Resume Optimisation, Skill Enhancement, and others.

Overall, this structure offers the application's functions in a simple and organised manner.

#### c) Resume ATS Tracking Application:

This code makes a two-column layout using Streamlit.

In the left column ('col1'), there is a heading urging visitors to begin their career journey, followed by a text box for copying the job description and a file uploader for uploading the resume.

When you click the "Submit" button, it obtains the text from the uploaded PDF resume, creates a response using the 'get\_gemini\_response' function based on the job description, and displays it as a subheader.

The right column ('col2') shows a picture that represents the career journey notion.

#### d) F.A.Q:

This code splits the page into two columns by calling Streamlit's 'st.columns()' method.

The right column ('col2') has a FAQ section containing questions and answers concerning CareerCraft. Each question and answer pair is given with 'st.write()'.

'avs.add\_vertical\_space()' adds vertical space between each question and answer pair.

An image is shown in the left column ('col1') by calling 'st.image()'.

## 4. Model Optimization and Tuning Phase

For Model Optimization and Tuning, the prompt is changed and fine-tuned to avoid hallucinations and variation in the overall matching percentage of the resume with the job description.

This allows the model to respond more accurately to the resume and give missing keywords relevant to the job description.

The model is optimized to extract relevant information such as job title, skills, experience, education, etc. It is also ensured that the summary is concise and informative.

The prompt is written and optimized to be as informative and pertinent to the job description

A screenshot of the input prompt used is given below

```
input_prompt="""
As an experienced ATS (Applicant Tracking System), proficient in the technical domain encompassing
Software Engineering, Data Science, Data Analysis, Big Data Engineering, Web Developer, Mobile App
Developer, DevOps Engineer, Machine Learning Engineer, Cybersecurity Analyst, Cloud Solutions Architect,
Database Administrator, Network Engineer, AI Engineer, Systems Analyst, Full Stack Developer, UI/UX
Designer, IT Project Manager, and additional specialized areas, your objective is to assess
resumes against provided job descriptions. In a competitive job market, your expertise is crucial
in offering top-notch guidance for resume enhancement. Assign precise matching percentages based on the JD
(Job Description) and identify any missing keywords with accuracy.

resume: {text}
description: {jd}

I want the response in the following structure:
The first line indicates the percentage match with the job description in multiples of 5 (JD).
The second line presents a list of missing keywords,
this should be included in context of the job description provided and
keywords not directly related to the job description should not be given as missing.
The third section provides a concise profile summary along with improvements required.

Mention the title for all the three sections.
While generating the response put some space between all the three sections
"""
```

## 5. Results

The application is deployed via the Python terminal and the StreamLit app is initialised by running this command

```
streamlit run app.py
```

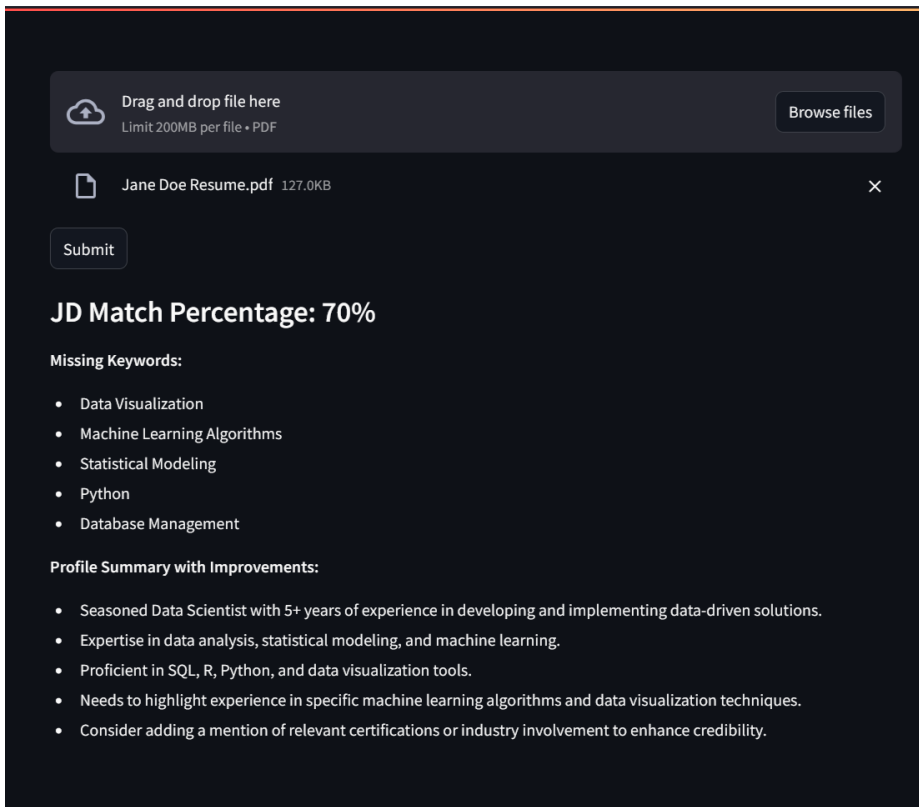

Once it is initialised, then StreamLit UI will initialise the webpage and the URL for this webpage.

Local URL: `http://localhost:xxxx`

The webpage is fully functional and it can perform the basic task.

First, type in the job title and job description that is required for matching the job requirements, then upload the resume which should be in a PDF format.

After uploading is done, click 'Submit' and it should take a while to generate the response for your resume description.

The screenshot displays the Streamlit application interface. At the top, there is a file upload section with a cloud icon and the text "Drag and drop file here" and "Limit 200MB per file • PDF". A "Browse files" button is located to the right. Below this, a file named "Jane Doe Resume.pdf" (127.0KB) is shown with a close button (X). A "Submit" button is positioned below the file list. The results section shows a "JD Match Percentage: 70%". Under "Missing Keywords:", there is a list of keywords: Data Visualization, Machine Learning Algorithms, Statistical Modeling, Python, and Database Management. Under "Profile Summary with Improvements:", there is a list of suggestions: Seasoned Data Scientist with 5+ years of experience in developing and implementing data-driven solutions, Expertise in data analysis, statistical modeling, and machine learning, Proficient in SQL, R, Python, and data visualization tools, Needs to highlight experience in specific machine learning algorithms and data visualization techniques, and Consider adding a mention of relevant certifications or industry involvement to enhance credibility.

## 6. Advantages and Disadvantages

### Advantages:

1. **Advanced NLP:** Gemini is a large language model (LLM) with powerful Natural Language Processing (NLP) features. This enables it to fully understand the intricacies of human language better than simpler keyword-matching algorithms, resulting in more accurate resume analysis for ATS compatibility.
2. **Flexibility:** Unlike rule-based systems, Gemini can accommodate a variety of writing styles and resume formats.
3. **Keyword Recognition:** Gemini can accurately detect relevant terms from both the resume and the job description. This allows you to personalize your resume to showcase skills and experiences that are relevant to the job criteria.
4. **Scalability:** Gemini's architecture makes it possible for it to effectively managing large volumes of resumes, which makes it suitable for companies that receive an immense number of applications.
5. **Integration Potential:** For a smooth workflow, the API can be integrated with currently in use applicant tracking systems (ATS).

### Disadvantages:

1. **Limited Explainability:** In contrast to rule-based systems, Gemini's decision-making process can be difficult to comprehend when it comes to presenting a score or recommendation. The lack of ability to see things clearly can make it difficult to troubleshoot errors or improve the analysis further.
2. **Data Dependency:** The level of quality and variety of the training dataset determines how well Gemini performs. The model's outputs may reflect biases found in the training dataset. It's critical to identify potential biases and take action to reduce them.
3. **API Access:** Depending on usage, access to Google's Generative AI API may be charged in order to use different Gemini models.
4. **Cost of Usage:** It can be computationally expensive to run Gemini model. Depending on your usage and pricing plan, this could result in higher costs.
5. **Fairness and Bias:** There is always a chance that AI models will be biased, even with mitigation techniques in place. To guarantee a fair and impartial review of each candidate's resume, monitoring and assessment must occur on a regular basis.

## 7. Conclusion

The Gemini AI model is notable for its adaptability and accuracy in managing complicated data jobs across sectors. By leveraging deep learning and natural language processing capabilities, companies can confidently extract important insights, optimise processes, and make data-driven choices. Its versatility makes it a valuable tool for improving operational efficiency and generating innovation in today's changing business environment.

To conclude, the future of ATS-optimized resume analysis using generative AI models such as Gemini appears to be very promising, even though there are still issues to be resolved. These models have the potential to facilitate a more sophisticated and nuanced evaluation of candidates, resulting in a more efficient and equitable recruitment process. By embracing AI responsibly and ethically, businesses can use its power to find top talent and make data-driven hiring decisions that benefit both the company and the candidates.

## 8. Future Scope

Gemini and other generative AI models have the potential to completely change the way resume analysis is done in Applicant Tracking Systems (ATS) going forward. Beyond just matching keywords, these models can analyze a resume's overall structure, writing style, and terminology usage to give a more comprehensive assessment of a candidate's qualifications. This could also be used to evaluate soft skills, such as communication, teamwork, and problem-solving skills, by examining linguistic patterns. AI can also enhance the candidate matching process by taking into account a candidate's complete background to find transferable skills that are valuable to the organization even if they aren't stated in the job description. By reducing prejudice in job descriptions and resumes, this can promote diversity and inclusion.

The employers' time can be saved by using AI to automate the shortlisting of resumes based on key requirements. It is even capable of proposing customized interview questions and subjects based on the job requirements and the candidate's characteristics. In an ideal future, AI-powered resume analysis would integrate with ATS, CRM, and other talent management systems to provide a seamless and effective hiring process. AI models would constantly learn from and evolve according to previous decisions, enhancing their ability to recognize the best candidates. But it's also important to address ethical issues with impartiality, fairness, and openness in decision-making. Moreover, as AI develops further, standards and laws may be required to guarantee its responsible application in the recruiting process.

Overall, generative AI models have the potential to transform resume analysis and the recruitment process; however, careful consideration of their limitations and responsible implementation are required.

## 9. Appendix

### 9.1 Source Code:

```
from dotenv import load_dotenv
import streamlit as st
from streamlit_extras import add_vertical_space as avs
import google.generativeai as genai
import os
import PyPDF2
from PIL import Image

load_dotenv()

genai.configure(api_key=os.getenv("GOOGLE_API_KEY"))

model = genai.GenerativeModel('gemini-pro')

def get_gemini_response(input):
    response = model.generate_content(input)
    return response.text

def input_pdf_text(uploaded_file):
    reader = PyPDF2.PdfReader(uploaded_file)
    text = ''
    for page_num in range(len(reader.pages)):
        page = reader.pages[page_num]
        text += str(page.extract_text())
    return text
